Your company has been selected to design a website for a catering business called Carolyne's Creations. In addition to catering, Carolyne's services include cooking classes and daily specials available as take-out meals. She also has a retail shop that stocks gourmet treats and kitchen items.

1. Create a wireframe for this website that includes a home page and child pages named **shop.html**, **classes.html, catering.html,** and **recipes.html**. Create two more child pages under the classes.html page called **children.html** and **adults.html**.

2. Create a new local site folder for the site in the drive and folder where you save your website files, then name it **cc**.

3. Create a website with the name **Carolyne's Creations**, using the cc folder for the local site folder.

4. Create an assets folder for the site and set the assets folder as the default location for images.

5. Open dw1_6.html from the where you store your Data Files then save it as **index.html** in the cc folder.

6. Reset the source for the banner to automatically save the cc_banner.jpg file in the assets folder.

7. Using Figure 30 and your wireframe as guides, create the additional pages shown for the website.

8. Refresh the Files panel to sort the files alphabetically.

9. Close all open pages.
